CAT SRM CALIBRATION PROCEDURE

The following test equipment is required in order to perform calibration of the instrument.

1. A high input impedance digital voltmeter of at least 3½ digit accuracy.
2. A DC coupled, triggered oscilloscope.
3. A digital frequency counter, strobe tuner, or suitable frequency standard.
4. An amplifier with speaker or headphones capable of high fidelity.

Before beginning the calibration procedure, the following steps must be taken.

1. Be sure that the instrument has warmed up for at least one half hour.
2. Connect the audio output to a monitor amplifier.
3. Center the Octave Shift switch and Pitch Bend controls.
4. Be sure that all modulation controls and glide are fully off.
5. "Fe" control fully up and "Q" control fully down.
6. VCA switch is in the BYPASS position.
7. All pedal inputs disconnected.

NOTE: CALIBRATION MUST BE PERFORMED IN THE SEQUENCE PRESENTED. FAILURE TO DO SO WILL RESULT IN AN IMPROPERLY TUNED INSTRUMENT.

<tr>
<th>TRIMMER</th>
<th>ADJUSTMENT</th>
<th>PROCEDURE</th>
</tr>
</thead>
</table>
|        | KEYBOARD CURRENT | 1. Monitor the CONTROL VOLTAGE output (ring of the TO SLAVE output jack) with a digital voltmeter.  
| 2       |                  | 2. Adjust the KEYBOARD CURRENT TRIMMER for a difference of exactly 3.000 volts between the highest and lowest keys depressed on the keyboard. |
|         | VCO 1 RANGE      | 1. Place the KEYBOARD CONTROL switch in the MONO position.  
| 8       |                  | 2. Turn up the VCO 1 sawtooth slider.  
|         |                  | 3. Set the VCO 1 COARSE and FINE TUNE controls to the 12 o'clock position.  
|         |                  | 4. Pin A2 on the keyboard.  
|         |                  | 5. Adjust the VCO 1 RANGE TRIMMER until the frequency of VCO 1 is approximately 440 Hz. |
| 14      | VCO 2 RANGE      | 1. Turn up the VCO 2 sawtooth slider.  
|         |                  | 2. Set the VCO 2 TUNE control to 12 o'clock.  
|         |                  | 3. Pin A2 on the keyboard.  
|         |                  | 4. Adjust the VCO 2 RANGE TRIMMER until the frequency of VCO 2 is equal to that of VCO 1 (440 Hz). |
| 13      | VCO 2 V/OCT      | 1. Place the KEYBOARD CONTROL in the OFF position.  
|         |                  | 2. Pin high C on the keyboard.  
|         |                  | 3. Using the VCO 1 FREQUENCY controls, tune VCO 1 to VCO 2 until zero beat occurs.  
<p>|         |                  | 4. Depress low C and adjust the VCO 2 V/OCT TRIMMER until |</p>
<table>

| 4       | OCTAVE TRANSPOSE   | 1. Leave the VCO 1 KEYBOARD CONTROL switch in the OFF position.  
|         |                    | 2. Pin high C.  
|         |                    | 3. Tune VCO 1 and VCO 2 to zero beat.  
|         |                    | 5. Place the OCTAVE switch in the 42 position.  
|         |                    | 6. Adjust the OCTAVE TRANSPOSE TRIMMER for zero beat between VCO 1 and VCO 2.                                                          |
| 3       | PITCH BEND         | 1. Repeat steps 1, 2, and 3 for the OCTAVE TRANSPOSE adjustment.  
|         |                    | 2. Depress C3.  
|         |                    | 3. Place the PITCH BEND slider in the 41 position.  
|         |                    | 4. Adjust the PITCH BEND TRIMMER for zero beat between VCO 1 and VCO 2.                                                                |
| 9       | CV 1 V/OCT         | 1. Place the KEYBOARD CONTROL switch in the MONO position.  
|         |                    | 2. Pin high C on the keyboard.  
|         |                    | 3. Turn up the VCO 1 and VCO 2 sawtooth sliders.  
|         |                    | 4. Depress low C with high C still pinned.  
|         |                    | 5. Adjust the VCO 1 FREQUENCY controls for zero beat between VCO 1 and VCO 2.                                                          |
|         |                    | 6. Release low C and adjust the CV 1 V/OCT TRIMMER for zero beat.  
|         |                    | 7. Repeat steps 2, 3, 4, 5; and 6 until no further adjustment is necessary.                                                              |
| 7       | CV 2 V/OCT         | 1. Place the KEYBOARD CONTROL switch in the POLY position.  
|         |                    | 2. Pin high C and depress low C.  
|         |                    | 3. Adjust VCO 1 frequency for zero beat with VCO 2.  
|         |                    | 4. Release low C with high C still pinned.  
|         |                    | 5. Adjust the CV 2 V/OCT TRIMMER until VCO 1 and VCO 2 are at zero beat.                                                                  |
|         |                    | 6. Repeat steps 2, 3, 4, and 5 until no further adjustment is necessary.                                                                  |
| 6       | POLY/MONO BALANCE  | 1. Place the KEYBOARD CONTROL switch in the POLY position.  
|         |                    | 2. Pin high C.  
|         |                    | 3. Tune VCO 1 and VCO 2 to zero beat.  
|         |                    | 4. Place the KEYBOARD CONTROL switch in the MONO position.  
|         |                    | 5. Adjust the POLY/MONO BALANCE TRIMMER for zero beat.                                                                              |
|   | VCO 1 INITIAL PULSE WIDTH | 1. Turn up the VCO 1 $\uparrow$ slider and turn all other audio sources fully off.  
2. Check that the PULSE WIDTH control is fully off.  
3. Monitor the synthesizer output with an oscilloscope.  
4. Adjust the VCO 1 INITIAL PULSE WIDTH TRIMMER for 50% duty cycle. |
|---|--------------------------|---|
| 12| VCO 2 PULSE WIDTH        | 1. Turn up the VCO 2 $\uparrow$ slider and turn all other audio sources fully off.  
2. Using the same procedure for VCO 2 as in VCO 1, adjust the VCO 2 PULSE WIDTH TRIMMER for 50% duty cycle. |
| 10| VCO 1 TRIANGLE SYMMETRY  | 1. Turn up the VCO 1 $\uparrow\uparrow$ slider and turn all other audio sources fully off.  
2. Monitor the output of the synthesizer with an oscilloscope.  
3. Adjust the TRIANGLE WAVE SYMMETRY TRIMMER until the waveform is symmetrical. |
| 5 | ADSR ATTACK ADJ.         | 1. Place the "A" and "S" sliders of the ADSR fully up with the "D" and "R" sliders fully down.  
2. Bring up the VCO 1 sawtooth slider and turn all other audio sources off.  
3. Check that the ADSR REPEAT switch is in the OFF position.  
4. Turn up the VCO 1 MODULATION CONTROL corresponding to the switch with the ADSR $\downarrow\downarrow$ position fully clockwise. Be sure that this switch is in the ADSR $\uparrow\uparrow$ position.  
5. Place the OCTAVE switch in the -2 position and the PITCH bend control in the -1 position.  
6. Depress C2 and adjust the ADSR TRIMMER for a smooth transition from the ATTACK to the SUSTAIN level. This will be evident as a rising pitch that smoothly levels off as a key is held down. |
| 1 | GATE 2 ADJ.              | 1. Pin low C on the keyboard.  
2. Bring up a VCO 1 waveform slider and turn all other audio sources off.  
3. Place the KEYBOARD CONTROL switch in the POLY position.  
4. Place the VCA switch in the $\uparrow$ (AR) position.  
5. Bring the "R" slider of the AR up one half with the "A" slider all the way down.  
6. Strike each key above low C one at a time and adjust the GATE 2 TRIMMER so that each note holds pitch after the key is released. Be sure that the keyboard contacts are clean and properly adjusted before undertaking this calibration. |
| 15 | VCF V/OCT | 1. Turn all audio sliders fully off.  
2. Bring up "Q" control so that VCF oscillates.  
3. Turn up the VCF KEYBOARD CONTROL to maximum (1 V/OCT).  
4. Pin A3 on keyboard.  
5. Using the "Fe" control, adjust the VCF frequency to 1720 Hz.  
6. Depress Al, and adjust the VCF V/OCT TRIMMER for 440 Hz.  
7. Repeat steps 5 and 6 until no further adjustment is necessary. |
|---|---|---|
| 16 | VCA CONTROL REJECT | 1. Connect an oscilloscope to the high audio output.  
2. Turn up the VCA VOLUME to maximum.  
3. Place the VCA switch in the / \ (ADSR) position.  
4. Bring all audio sliders, "Fc", and "Q" controls all the way down.  
5. Bring the "S" slider of the ADSR up fully with all other ADSR sliders set to minimum.  
6. Place the ADSR REPEAT switch in the AUTO position.  
7. Bring up the LFO FREQUENCY slider to maximum.  
8. Be sure that the VCF modulation controls are fully off and that no keys are pinned down.  
9. Adjust the VCA CONTROL REJECT TRIMMER for minimum output. |
NOTICE: TO ALL OWNERS OF OCTAVE SYNTHESIZERS

To help make Octave Synthesizers better suit your personal needs, certain custom modifications are now available subject to the following terms:

1) All modifications must be performed by the factory only.

2) Shipping charges both to and from the factory must be prepaid by the customer.

3) A certified check or money order must accompany the unit or be mailed in advance.

4) Customer must contact the factory in writing for a RETURN AUTHORIZATION NUMBER prior to shipping the unit. Units with no return authorization number will be refused by the factory.

5) Modifications are guaranteed for 1 year parts and 90 days labor and are subject to the standard terms of the OCTAVE warrantee as supplied with the unit.

6) The factory reserves the right to select the orientation of panel control additions dependent upon space variations.

7) Along with the modification performed, the unit will be recalibrated and given a general check. No repairs will be performed unless the customer is notified.

A portion of the cost of a modification is due to the fact that the instrument has to be dismantled and reconstructed in order to gain access to the modified areas. Because of this, several modifications performed on the same unit at the same time will be less expensive than those modifications done separately.

In view of this, the following discounts apply to multiple modifications performed on the same unit at the same time:

First modification: Price as listed
Each add'l modification: Less $10.00 per modification

Please inquire in writing about any modifications not listed that would better suit your needs.

PACKAGE PRICES:

**P-01 UPGRADE OF A-1000 SERIES TO SRM STATUS**

This package is recommended for those wishing to upgrade the performance of their A-1000 series CAT to the SRM level.

Package includes:
- M-05 LFO monitor $40.00
- M-06 LFO Delay 80.00
- M-09 Center locked pitch bend 30.00
- M-12 2-Note Memory 225.00
- M-15 VCO1 pedal input 75.00 (includes pedal)
- M-23 SRM panel knobs 20.00

**Total** $470.00
**Package** 370.00

**P-02 ELECTRONIC MUSIC STUDIO PACKAGE**

This package upgrades an SRM so that it can be used for electronic music studio experimentation since it allows the internal devices to interact with external systems and increases the versatility of the existing modules.

Package includes:
- M-01 HP/LP VCF $40.00
- M-02 12/24 dB VCF 40.00
- M-04 LFO square offset 40.00
- M-10 Interface pedal 75.00 (includes pedal)
- M-13 VCA pedal input 80.00 (includes pedal)
- M-17 Keyboard trigger 40.00
  on S+H
- M-18 Glide on auto S+H 40.00
- M-19 Ring Modulator 240.00
- M-21 VCF bypass sw's 50.00
- M-22 Input/Output patch 150.00
  **system**

**Total** 795.00
**Package** 650.00

**P-03 PERFORMANCE PACKAGE**

These modifications are packaged to significantly increase the performance versatility of the SRM.

Package includes:
- M-01 HP/LP VCF $40.00
- M-04 LFO square offs. 40.00
- M-07 LFO sine ampl. 85.00 (includes pedal)
- M-08 Bend interval 40.00
- M-10 Interface pedal 75.00 (includes pedal)
- M-11 Ganged mod. atten. 50.00
- M-13 VCA pedal 80.00 (includes pedal)

**Total** $410.00
**Package** 315.00
**M-01 HIGH PASS/LOW PASS VCF SELECTOR SWITCH**

A miniature toggle switch is added to the VCF module. In one position, the VCF becomes a voltage controlled low-pass filter, as it normally is, and attenuates all frequencies above \( F_c \). In the other position, the VCF becomes a voltage controlled high-pass filter and attenuates all frequencies below \( F_c \).

**M-02 12/24 dB/octave FILTER SLOPE**

A miniature toggle switch is added to the VCF module. In one position, the VCF rolloff is 24dB/octave, as it normally is, and in the other position the rolloff becomes 12dB/octave.

**M-03 MANUAL HIGH PASS FILTER**

A rotary potentiometer is added to the front panel. This control adjusts the cutoff of a passive, manually set (not voltage controlled), highpass filter. The cutoff range is approximately 20Hz to 10Khz with a rolloff of -6dB/octave. The filter is placed inbetween the VCF and VCA modules.

**M-04 LFO SQUARE WAVE OFFSET SWITCH**

A miniature toggle switch is added to the panel. In one position, the LFO square wave alternates between ground and a positive voltage, while in the other position, the square wave alternates between balanced plus and minus voltages. This allows LFO square wave modulations above and below a reference or only above the reference.

![Square wave with offset](image)

**M-05 LFO MONITOR LAMP**

An LED monitor lamp for the LFO frequency (similar to that on the SRM and kitten synthesizers) is added to the A-1000 series CAT synthesizers.

**M-06 LFO DELAY**

A rotary potentiometer is added to the front panel of the A-1000 series CAT synthesizer to control the delay time of the LFO sine wave. This delay is trigger sensitive and is continuously variable from 0 to 5 seconds. The resulting effect is similar to that of the SRM and Kitten LFO delay.
A rotary potentiometer is added to the panel near the pitch bend slider. Also, a jack is added to the rear of the unit. When the foot pedal supplied is plugged into this jack, the LFO sine amplitude can be varied from zero to full with the pedal; the panel pot controls the pedal sensitivity.

When the pedal is not used, the panel pot determines the LFO sine amplitude.

This modification also allows external voltage control of the LFO sine wave amplitude. The tip of the pedal cable is the control voltage input. Thus, a mono cable plugged into this jack will allow external voltage sources to control the LFO sine amplitude.

Note that this modification turns the LFO triangle wave on A-1000 series CATs into a sine wave.

The LFO sine wave can be controlled by the panel pot, foot pedal, or by an external modulation source.

A rotary potentiometer is added to the front panel near the pitch bend slider. When fully counter clockwise, the ends of the pitch bend slider will shift the pitch of the unit by about 1 semitone. When the interval control is fully clockwise, the ends of the pitch bender are about 2 octaves up and down. Thus, the interval control allows variations in pitch bend sensitivity from about one semitone to about plus and minus two octaves.

The pitch bend slider on the A-1000 series CAT is replaced with a center locking pitch bend as on the SRM and kitten.

A stereo jack is added to the rear of the instrument. The tip of this jack provides a 1 volt per octave input to the interface circuitry on the synthesizer. A voltage applied to this jack will shift the pitch of the entire unit in the same way as the pitch bender shifts the pitch of the entire unit.

When the pedal supplied is inserted into this jack, the pitch of the unit can be bent upwards with it. The range of the pitch bend is controlled by the sensitivity control on the pedal.
M-11 GANGED MODULATION ATTENUATORS

A miniature toggle switch is added below each of the two VCO2 modulation attenuators and the two VCF modulation attenuators. These switches cause the attenuators above them to become slaves to the VCO1 modulation attenuators. When the switch is on, the attenuator above it is disconnected from its modulation selector switch and is instead connected to the wiper of the respective VCO1 modulation attenuator.

This is useful for controlling the modulation depth of VCO 1, VCO 2 and the VCF with only the VCO 1 modulation depth controls. The figure should make this function obvious.

The added switches allow the VCO2 and VCF modulation depths to be governed by the VCO1 modulation depth settings so that all three modules can be varied with one or two rotary knobs.

M-12 2-NOTE MEMORY

The CAT series A-1000 memory system is upgraded to that of the SRM by adding a memory to the second note. The keyboard and internal memory circuitry are replaced (factory retains old keyboard) with the new SRM keyboard and circuitry. The external appearance of the unit is not altered.

The second memory allows the CAT second voice to be memorized after releasing the key so that both oscillators maintain the interval that was played before the keys were released.
A stereo jack is added to the back of the unit to allow access to the
VCA control voltage input. This jack can be used to control the volume
with a footpedal (included) or to allow an external device with a 0 to +10V
range to modulate the VCA.

The tip of the jack is connected to the control voltage input of the VCA
and the ring of the jack is connected to the modulation select switch of
the VCA. If the pedal is inserted, the modulation depth of the VCA is
controlled by the pedal setting. The VCA volume control serves as a pedal
sensitivity control.

If a ¼" mono cable is inserted into the jack, the modulation select switch
is disconnected and the tip of the cable provides access to the control
voltage input of the VCA. Allowable control voltage range is from 0 to
+10V.

An extra VCA allows pedal control and external source control
of the entire instrument's volume level

A stereo jack is added to the rear of the unit to allow pedal sweeping
of the VCO2 frequency similar to that of the VCO1 pedal input in the SRM
and KITTEN. The tip of this jack is connected to the VCO2 control voltage
input and provides a 1 volt/octave control voltage input to VCO2.
A pedal is supplied with this modification.

Same as VCO2 modification M-14 except for VCO1. This allows A-1000 series
CATS to be upgraded to the SRM level.
Pedal supplied.

A miniature toggle switch is added to the noise module to provide selection
between white and pink noise.

A miniature toggle switch is mounted near the S&H switch. In one position,
the S&H is triggered by the LFO, as it normally is. In the other position,
the keyboard trigger controls the S&H and a new sample is taken on every
keyboard trigger.
M-15 GLIDE CONTROL ON AUTO S&H

A rotary potentiometer is added to the panel to control the glide between sample steps. This allows gliding between notes when modulating the VCO'S with the S&H output.

M-19 RING MODULATOR

A 4-quadrant multiplier is added to the internal circuitry of the synthesizer to provide true ring modulation. One of the ring modulator inputs is connected to the VCO1 mixer output and the other input is connected to the VCO2 mixer output, thus allowing ring modulation between any of the mixed waveshapes of the 2 VCO'S. The ring modulator inputs are also connected to 1/8" mono jacks mounted on the rear of the unit. When a cable is inserted into either jack, the respective VCO is disconnected and replaced with the outside signal source. This allows either VCO to modulate an outside source. Each input is provided with a rotary attenuator. The output of the ring modulator is connected to the VCF through a rotary volume control to allow mixing of the ring modulation effects with the standard synthesizer sounds.

The Ring Modulator can modulate VCO1 with VCO2 or with external sources patched into the X and Y attenuated inputs.
Three stereo jacks are added to the back of the unit to allow access to the outputs of VCO1, VCO2 and noise for processing by external modifiers. The jacks are connected in such a way that if a stereo cable is plugged in, the tip of the stereo cable is the output of the respective module, and the ring is the input back into the VCF. This allows modifiers such as phase shifters, delay lines, fuzz boxes etc. to be placed in series between either VCO1, VCO2, or the noise and the VCF.

By adding these patching jacks, external modifiers can be connected in series with the sound sources.

Three miniature toggle switches are added to the panel to allow the noise, VCO1 and VCO2 modules to bypass the VCF and instead go directly to the VCA. This allows certain modules to be modified by the VCF and others to be unaffected, thus extending the ability to create complex timbres.

By adding these bypass switches, the sound sources can bypass the VCF and go directly to the VCA.
The outputs of the LFO sine, square, ADSR, AR, S&H, VCO1, VCO2 mixers and noise are brought to back panel jacks without disrupting their initial internal connections. This allows access to all of these modules for external processing. VCO1, VCO2, and VCF each are given an external extra modulation input for a total of 11 jacks.

These three inputs are connected in series with the first patch switch and modulation attenuator for VCO1, VCO2 and VCF. When a plug is inserted into one of these jacks, the mod source switch is disconnected and replaced by the external mod source. The attenuator normally corresponding to the disconnected mod source switch controls the external input mod depth. This mod is suggested for electronic music studio applications since it allows much more modulation capabilities and integrated processing of synthesizer signals with external modifiers.

A set of knobs and applicator tool to update the A-1000 to SRM status.
